In numerical analysis, Newton's method, also known as the Newton–Raphson method, named after Isaac Newton and Joseph Raphson, is a root-finding algorithm which produces successively better approximations to the roots (or zeroes) of a real -valued function.

The Newton-Raphson method, or Newton Method, is a powerful technique for solving equations numerically. Like so much of the differential calculus, it is based on the simple idea of linear approximation. The Newton Method, properly used, usually homes in on a root with devastating efficiency.

Many advantages are attributed to the Newton-Raphson (N-R) approach. Gauss-Seidel (G-S) is a simple iterative method of solving n number load flow equations by iterative method. It does not require partial derivatives. Newton-Raphson method is based on Taylor's series and partial derivatives.

The Newton-Raphson method which is employed for solving a single non-linear equation can be extended to solve a system of non-linear equations. Using multi-dimensional Taylor series, a system of non-linear equations can be written near an arbitrary starting point  $X_i = [x_1, x_2, \dots, x_n]$  as

We'll use the Newton-Raphson method to compute the cubic root of the number 2. This is a number that isn't as familiar as the square root of two, but it is easy enough to check on a pocket calculator that can do cubic roots.

## **Newton Raphson Method**

The Newton-Raphson method is based on the principle that if the initial guess of the root of  $f(x) = 0$  is at  $x_i$ , then if one draws the tangent to the curve at  $(x_i, f(x_i))$ , the point  $x_{i+1}$  where the tangent crosses the x-axis is an improved estimate of the root (Figure 1).

Using the definition of the slope of a function, at  $x = x_i$  if  $\tan \theta = \frac{f'(x_i)}{1}$

Newton's method, also known as Newton-Raphson, is an approach for finding the roots of nonlinear equations and is one of the most common root-finding algorithms due to its relative simplicity and speed. The root of a function is the point at which  $f(x) = 0$ .

The iteration attempts to find a solution in the nonlinear least squares sense. This is essentially the Gauss-Newton algorithm to be considered later. The Newton-Raphson method assumes the analytical expressions of all partial derivatives
